FOR IMMEDIATE RELEASE

TeamCast in pole position with DVB-T2

Rennes (France), September 2008 – IBC 2008 is the opportunity for TeamCast to unveil important results from its strong commitment to the development of the new **DVB-T2** standard for Digital Terrestrial TV.

First key result is the world first DVB-T2 modulator announced by TeamCast at IBC 2008. This new modulator is based on "**Power4Cast**[®]", a new product platform, powerful and flexible enough to handle various standards and functions on a single hardware core.

This first DVB-T2 product is the concrete result of several years of involvement in the standardisation process. From the beginning of the DVB work on T2 (early 2006) TeamCast has been highly active at several levels:

- through its leading technical contributions to the **DVB TM T2 subgroup** work;
- via TeamCast's position as chairman of the **EUREKA / CELTIC** project **B21C** ("Broadcast for the 21st Century") which represents 34 main players of the Broadcast industry in Europe. B21C has already devoted 18 months of work on to DVB-T2 definition and simulation;
- through its recent successful **SME42** ("SME for T2") project proposal, which was overall winner of the first **EUREKA / EUROSTARS** call for projects issued in February 2008. SME42 will produce a complete DVB-T2 working system and will contribute onto the validation of the standard.

"We have invested much in this new standard, and we are actively contributing to the DVB-T2 standardisation process which started early 2006 and has led to a DVB approved specification in June 2008," says **Gérard Faria, Chief Technical Officer** at TeamCast. "It is the logical continuation of what we have achieved in the past with DVB-H and DVB-SH. But our involvement for T2 has been deeper than ever, including large-scale collaborations with other world leading organisations. This is why we can already announce our DVB-T2 modulator, which I am sure, will be as successful as our world famous DVB-T/H modulator".
